KEY TO THE SPECIES OF SUBSECT. CONVOLVULOIDES

Pistillate bractlets with capitate-glandular margins.

Lobes of pistillate sepals gland-tipped, 2 or 3 per side; staminate involucellar lobes with glandular margins; petioles less than 5 mm long.

D. queirozii

Lobes of pistillate sepals eglandular, 5 or 6 per side; staminate involucellar lobes eglandular; petioles more than 10 mm long.

D. boliviana

Pistillate bractlets lacking capitate glands on margins.

Lobes of pistillate sepals gland-tipped.

Stigmas not over 1 mm across,

Stems hirsute; stamens 15-40; bracts unlobed or nearly so.

Peduncles over 1 cm long; bracts green; fr. pedicel < 5 mm

D. convolvuloides

Peduncles 1 cm long or less; bracts yellowish-white, pub.

Pedicel distinctly brownish; fr. ped. < 5 mm

D. leandrii

Stems not hirsute; stamens 12-15; bracts 3-lobed, yellow-green.

Stamens 15-35; bracts unlobed, white or pink.

Lobes of pistillate sepals not gland-tipped.

D. schenckiana

Bracts unlobed.

Staminate flowers 7; ovary and style hispidulous.

D. tenuiramea

Staminate flowers 10; ovary and style strigose.

D. denticulata

Bracts distinctly lobed.

D. nitida

Bracts 3-lobed, c. 2 cm long or more; stipules c. 5 mm long; peduncle 1-2 cm long.

D. hispida

Bracts 5-lobed, 3 cm long or more; stipules 8-10 mm long; peduncle 8 cm long or more.

D. arenalesensis
